

LevelField

Know who can know — before you do.

Structural information-asymmetry risk for event contracts — scored from contract text alone, verified by code, attested on-chain.

SOMNIA × DREAMDEX · EVENT CONTRACTS HACKATHON ·
2026

Live `levelfield.vercel.app`
Registry `0xb8e11dea...3165bbc7` · Somnia Shannon · source-verified

The field is not level

A price tells you what the crowd believes. **It doesn't tell you who could already know.**

■ Someone makes the outcome

Many events resolve on a person's or institution's decision — not on a market average nobody controls.

■ A circle knows it early

Between decision and disclosure there is a window where insiders simply know.

■ Nothing visible stops them

Whether early knowers can trade is a property of the contract's structure — invisible at the price.

levelfield — live product (deployed)

Every existing tool tracks insiders after the fact. Nothing warns before the trade.

Change nothing but the event

DreamDEX BTC price binary · timestamped snapshot

curated reference contract · individual decision

3 /100 low

SAME ENGINE · SAME RULES

95 /100 high

● Stage A — a model classifies, against public anchors

D1	Outcome Control	30%
D3	Insider Tradability	25%
D2	Knowledge Circle	20%
D4	Disclosure Synchronicity	15%
D5	Outcome Manufacturability	10%

Five dimensions, five anchored levels each — a fixed, public library (data/anchors), not a prompt. Any capable model can classify; none is required at runtime.

evidence quotes = verbatim substrings · machine-checked

the anchor library, as shipped in the product film

Stage B — deterministic code writes the number

```
score = round( 100 × Σ wd · (leveld - 1) / 4 )
```

CB floor · D3·3

80

CB floor · D3·4

90

CB floor · D3·5

95

fixed weights · graduated circuit-breaker floors

No model output is ever the score. Levels go in; audited code applies weights, cross-dimension rules and circuit breakers.

CB-1 one person controls + can trade →
floor 80/90/95

CB-2 cheaply manufacturable outcomes →
floor 75-90

unknown information → level 4, never a
guess low

```
score = round(100 · Σ wd · (leveld - 1) / 4)
```

bands low <25 ≤ moderate <50
≤ elevated <75 ≤ high

Attack text can never become evidence

■ Code scans, not the model

A code-level scanner detects instruction-like text addressed at automated assessors — independent of any model's judgment.

■ Whole sentences are tainted

Any evidence quote overlapping a tainted sentence is rejected outright; fabricated quotes fail the verbatim check.

■ A complicit model still can't hide it

Even if the calling model obeys the attacker, the server-side flag and caveats are forced onto the result.

real rejection: the fake quote is named, nothing is scored

Try it live: the curated injection-test contract ships in the product.

```
LEVELFIELD / LOCAL CAPTURE STAGEPASSED  
  
• • • pre-trade assessment / real stdio transcriptlocalhost only  
  
$ npm run demo:agentlow / moderate → PROCEED

LevelField agent demo: pre-trade risk check  
=====  
Connected to the LevelField MCP server over stdio (npx tsx packages/mcp/src/server.ts).  
  
Agent evaluates 2 markets before any action:  
 - 0x0000000000000000000000000000000000000000000000000000000000000000 [DreamDEX score snapshot]  
 - curated-celebrity-breakup [curated market]  
   snapshot: 2026-08-20T02:25:38.554Z  
  
Decision rule: PROCEED if band is low/moderate. DECLINE if band is elevated/high,  
quoting the summary and circuit breaker as the reason.  
  
=====  
Assessing 0x00000000000000000000000000000000000000000000000000000000000000476  
question: BTC closes at or above its opening price  
score:    3/100 (low) [from cache]  
summary:  No structural early-knowledge advantage is apparent: the outcome is produced and disclosed in ways no participant controls.
```

Any trading agent calls the LevelField MCP server pre-trade. The policy fits in one line:

low / moderate → PROCEED

elevated / high → DECLINE

The DreamDEX binary returns PROCEED at 3. The individual-decision case returns DECLINE at 95 — with the evidence attached.

Each score is published as an on-chain attestation any contract or agent can read without our site:

```
score · band · dims[5]
methodHash (pins the anchor-library
version)
scoredAt · sourceUri (immutable
commit, pinned at submission)
```

A verifier reads every field back and fails closed on anything missing or changed.

Built to grow the venue it audits

■ Traders

“Feels rigged” becomes a readable, auditable number — the trust barrier for new event categories drops.

■ Agents

A pre-trade MCP policy hook: DreamDEX is agent-first, and LevelField is the risk check an agent calls before acting.

■ The venue

A listing-time instrument for what comes after price binaries — score the category before it ships.

+ 11 evidence-backed SDK & documentation findings, delivered as the optional feedback report.
